

MeetNote AI

Sr. No.	Name	Emp ID
1	Ekta Tajne	3193218
2	Dhanashree Hiwase	3193205
3	Sharyu Mate	3202469
4	Yash Sathavane	3193223
5	Anjali Kumari	3193228

Problem Statement

In modern corporate environments, meetings are often inefficient and not inclusive. Employees spend a significant amount of time taking notes instead of actively participating in discussions. As a result, important information can be missed.

Additionally, fast-paced conversations create challenges for:

- People with hearing impairments
- Non-native speakers
- Employees who struggle to keep up with real-time discussions

There is currently no easy way to make meetings searchable, track key decisions, or extract important action items automatically.

A photograph of three people in a meeting. A man with grey hair and glasses is pointing at a laptop screen. A woman with dark curly hair and glasses is looking at the screen. Another man is standing behind them, also looking at the screen. They are in a modern office with large windows in the background.

Objectives

- **To convert speech into accurate text using AI (Whisper)**
- **To generate timestamped transcripts for easy navigation**
- **To make meetings searchable and well-documented**
- **To identify speakers and extract key information (future work)**
- **To improve accessibility for hearing-impaired and non-native speakers**
 - **To automatically extract action items and summaries**
- **To enhance overall productivity and participation in meetings**

WEEK 1

The Core (Transcription)

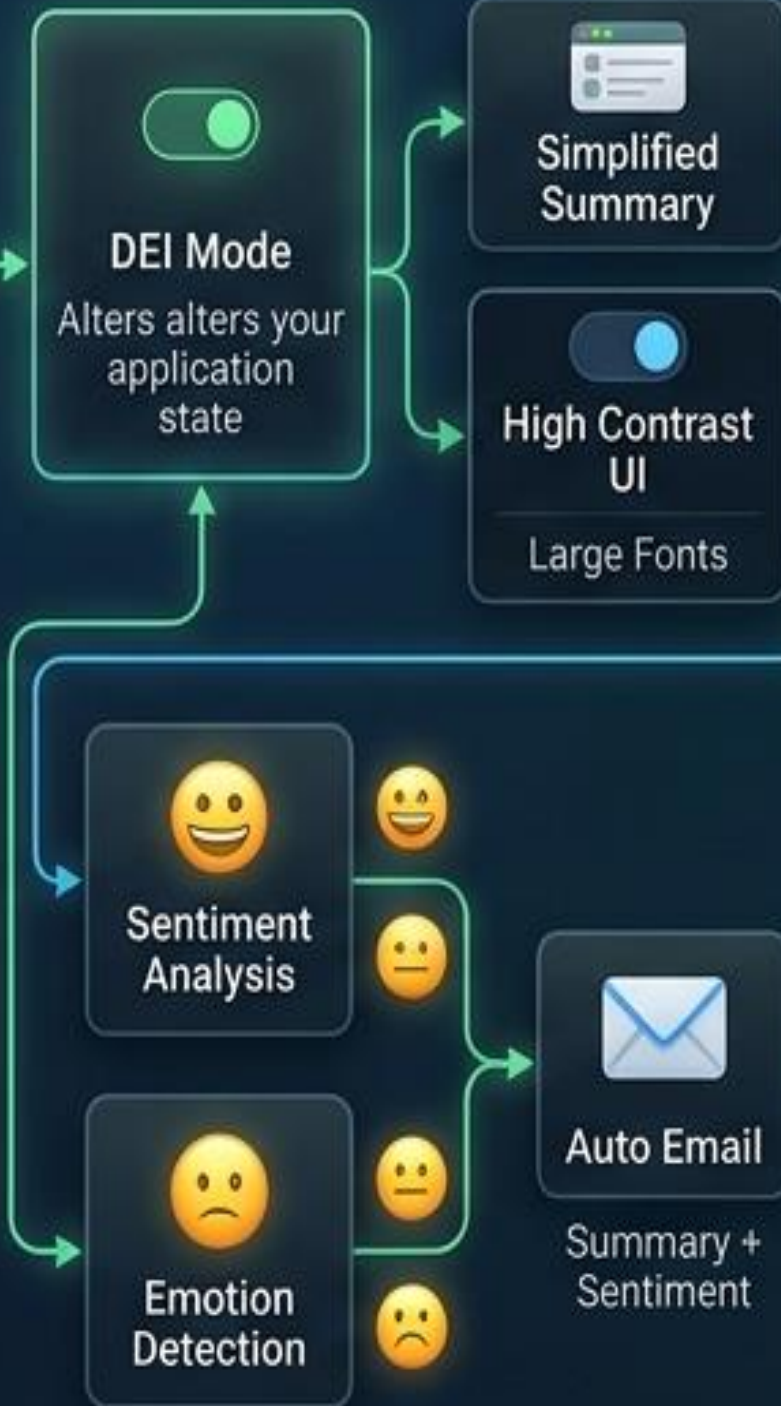

WEEK 2

The Brain (Contextual Extraction)

WEEK 3

The Inclusion (Accessibility)

WEEK 4

The Ecosystem (Integration)

Tech Stack

● **Frontend:**
React, Vite, Tailwind
CSS, Shadcn UI

● **Backend:**
Flask (Python),
SQLAlchemy, SQLite

● **AI Model:**
OpenAI Whisper

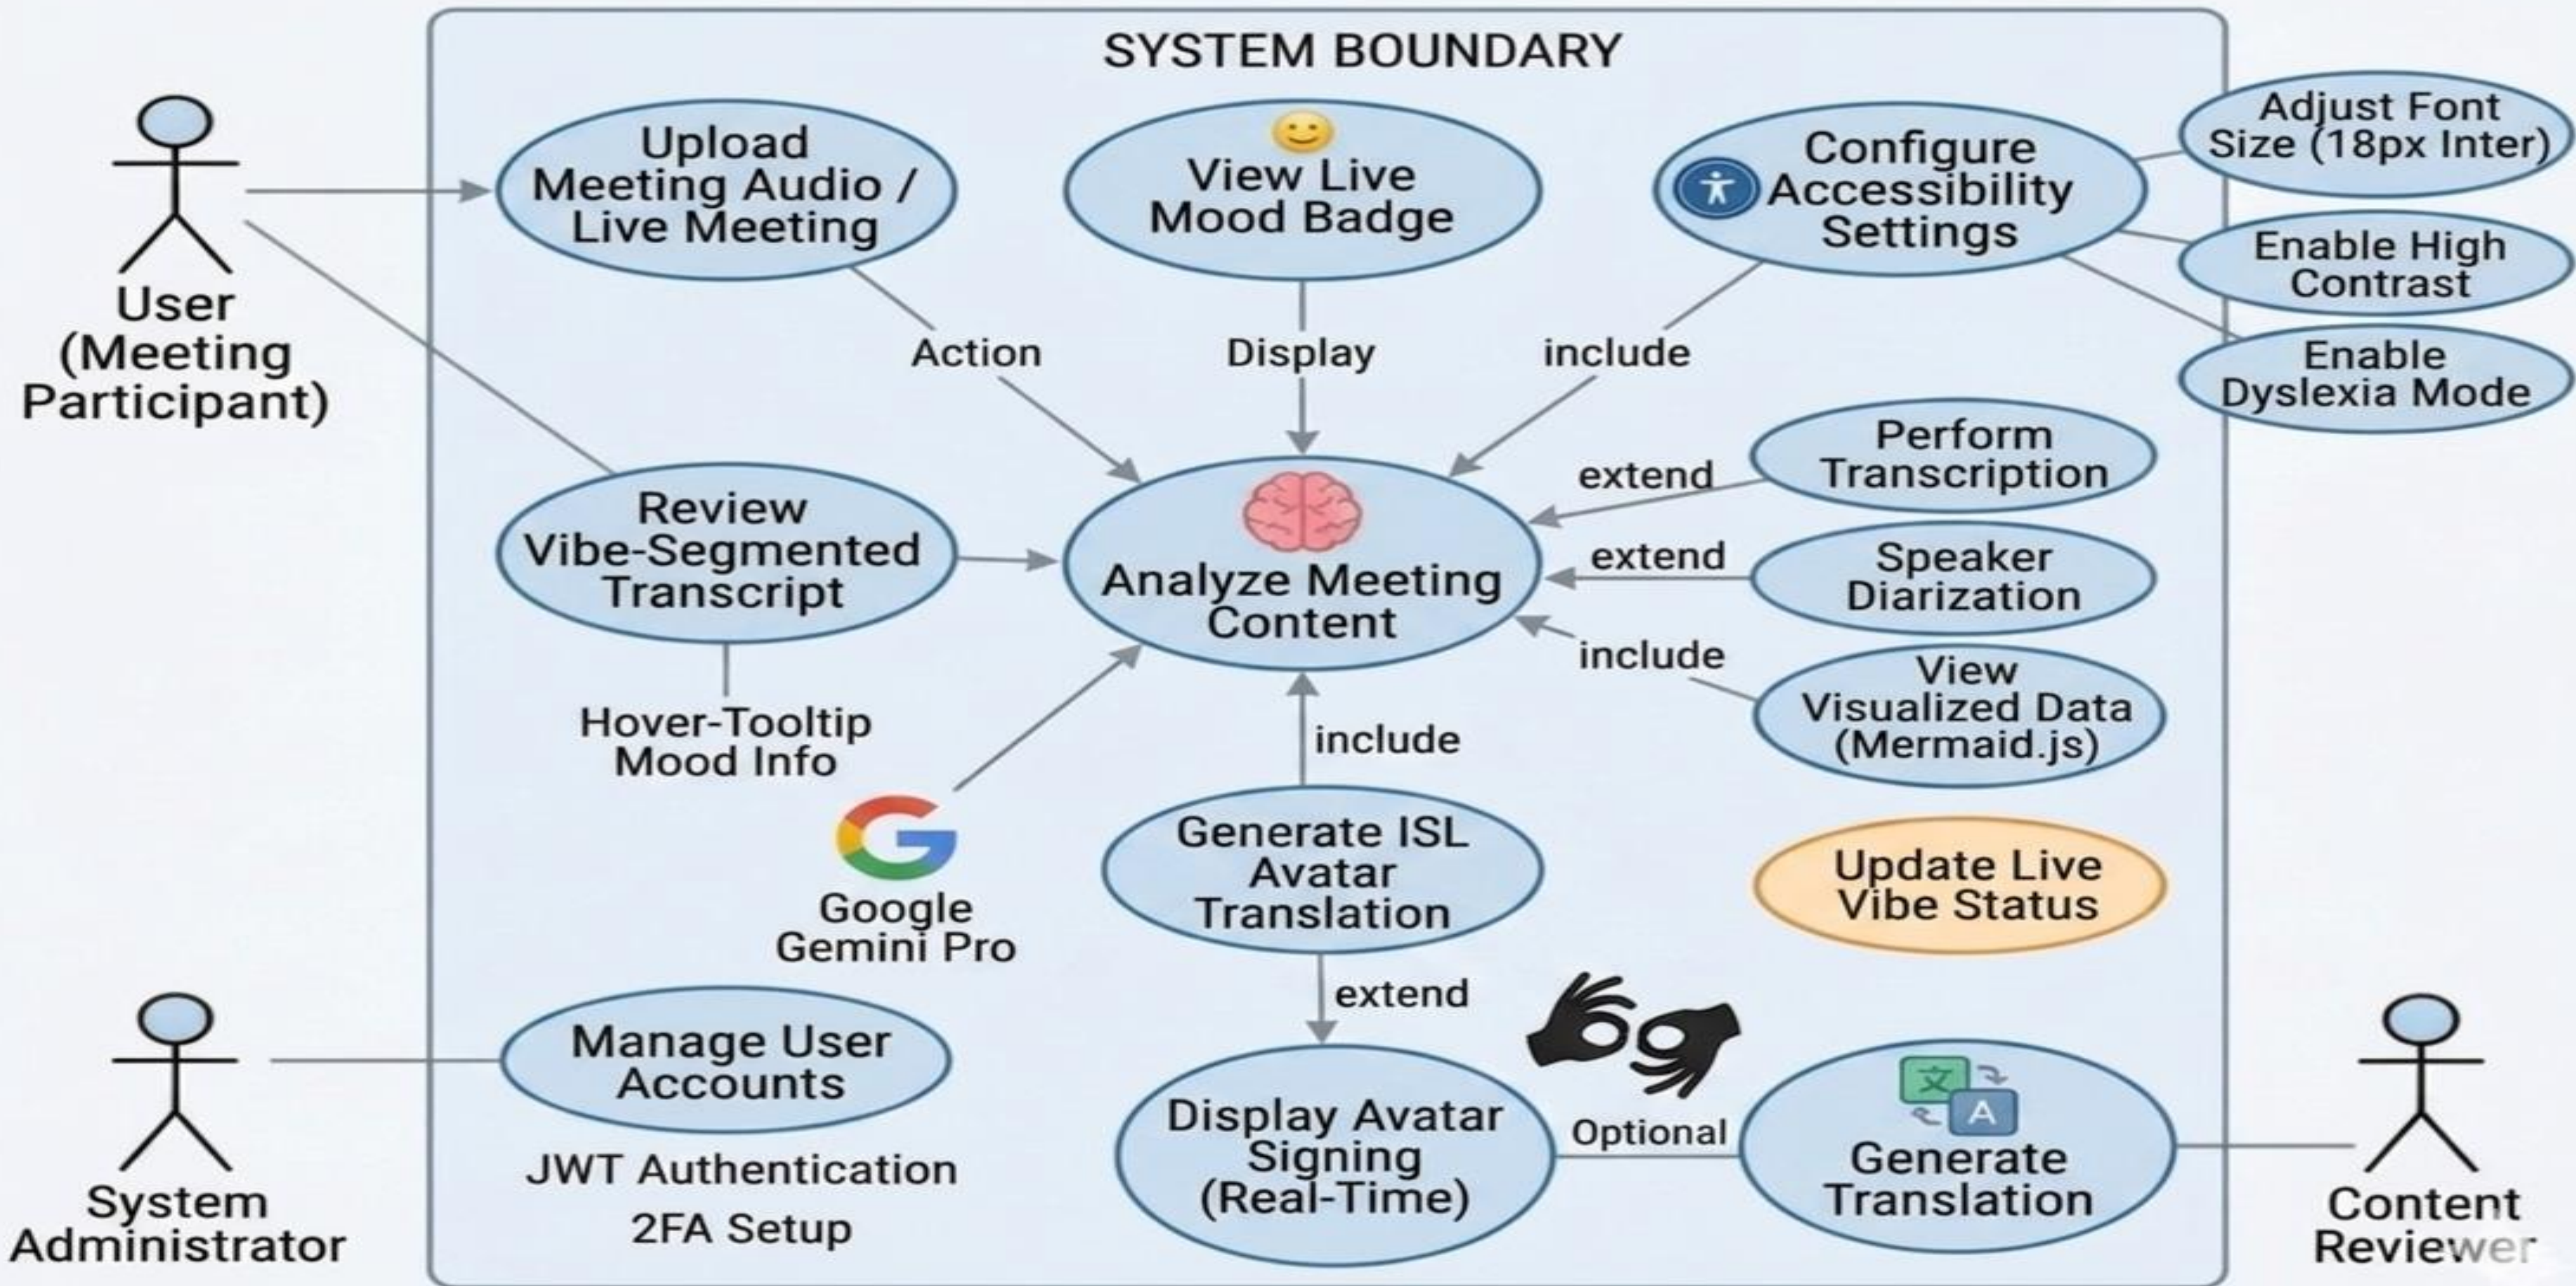

● **Security: :**
JWT
Authentication

● **Other Tools::**
Deep Translator,
Markmap.js..

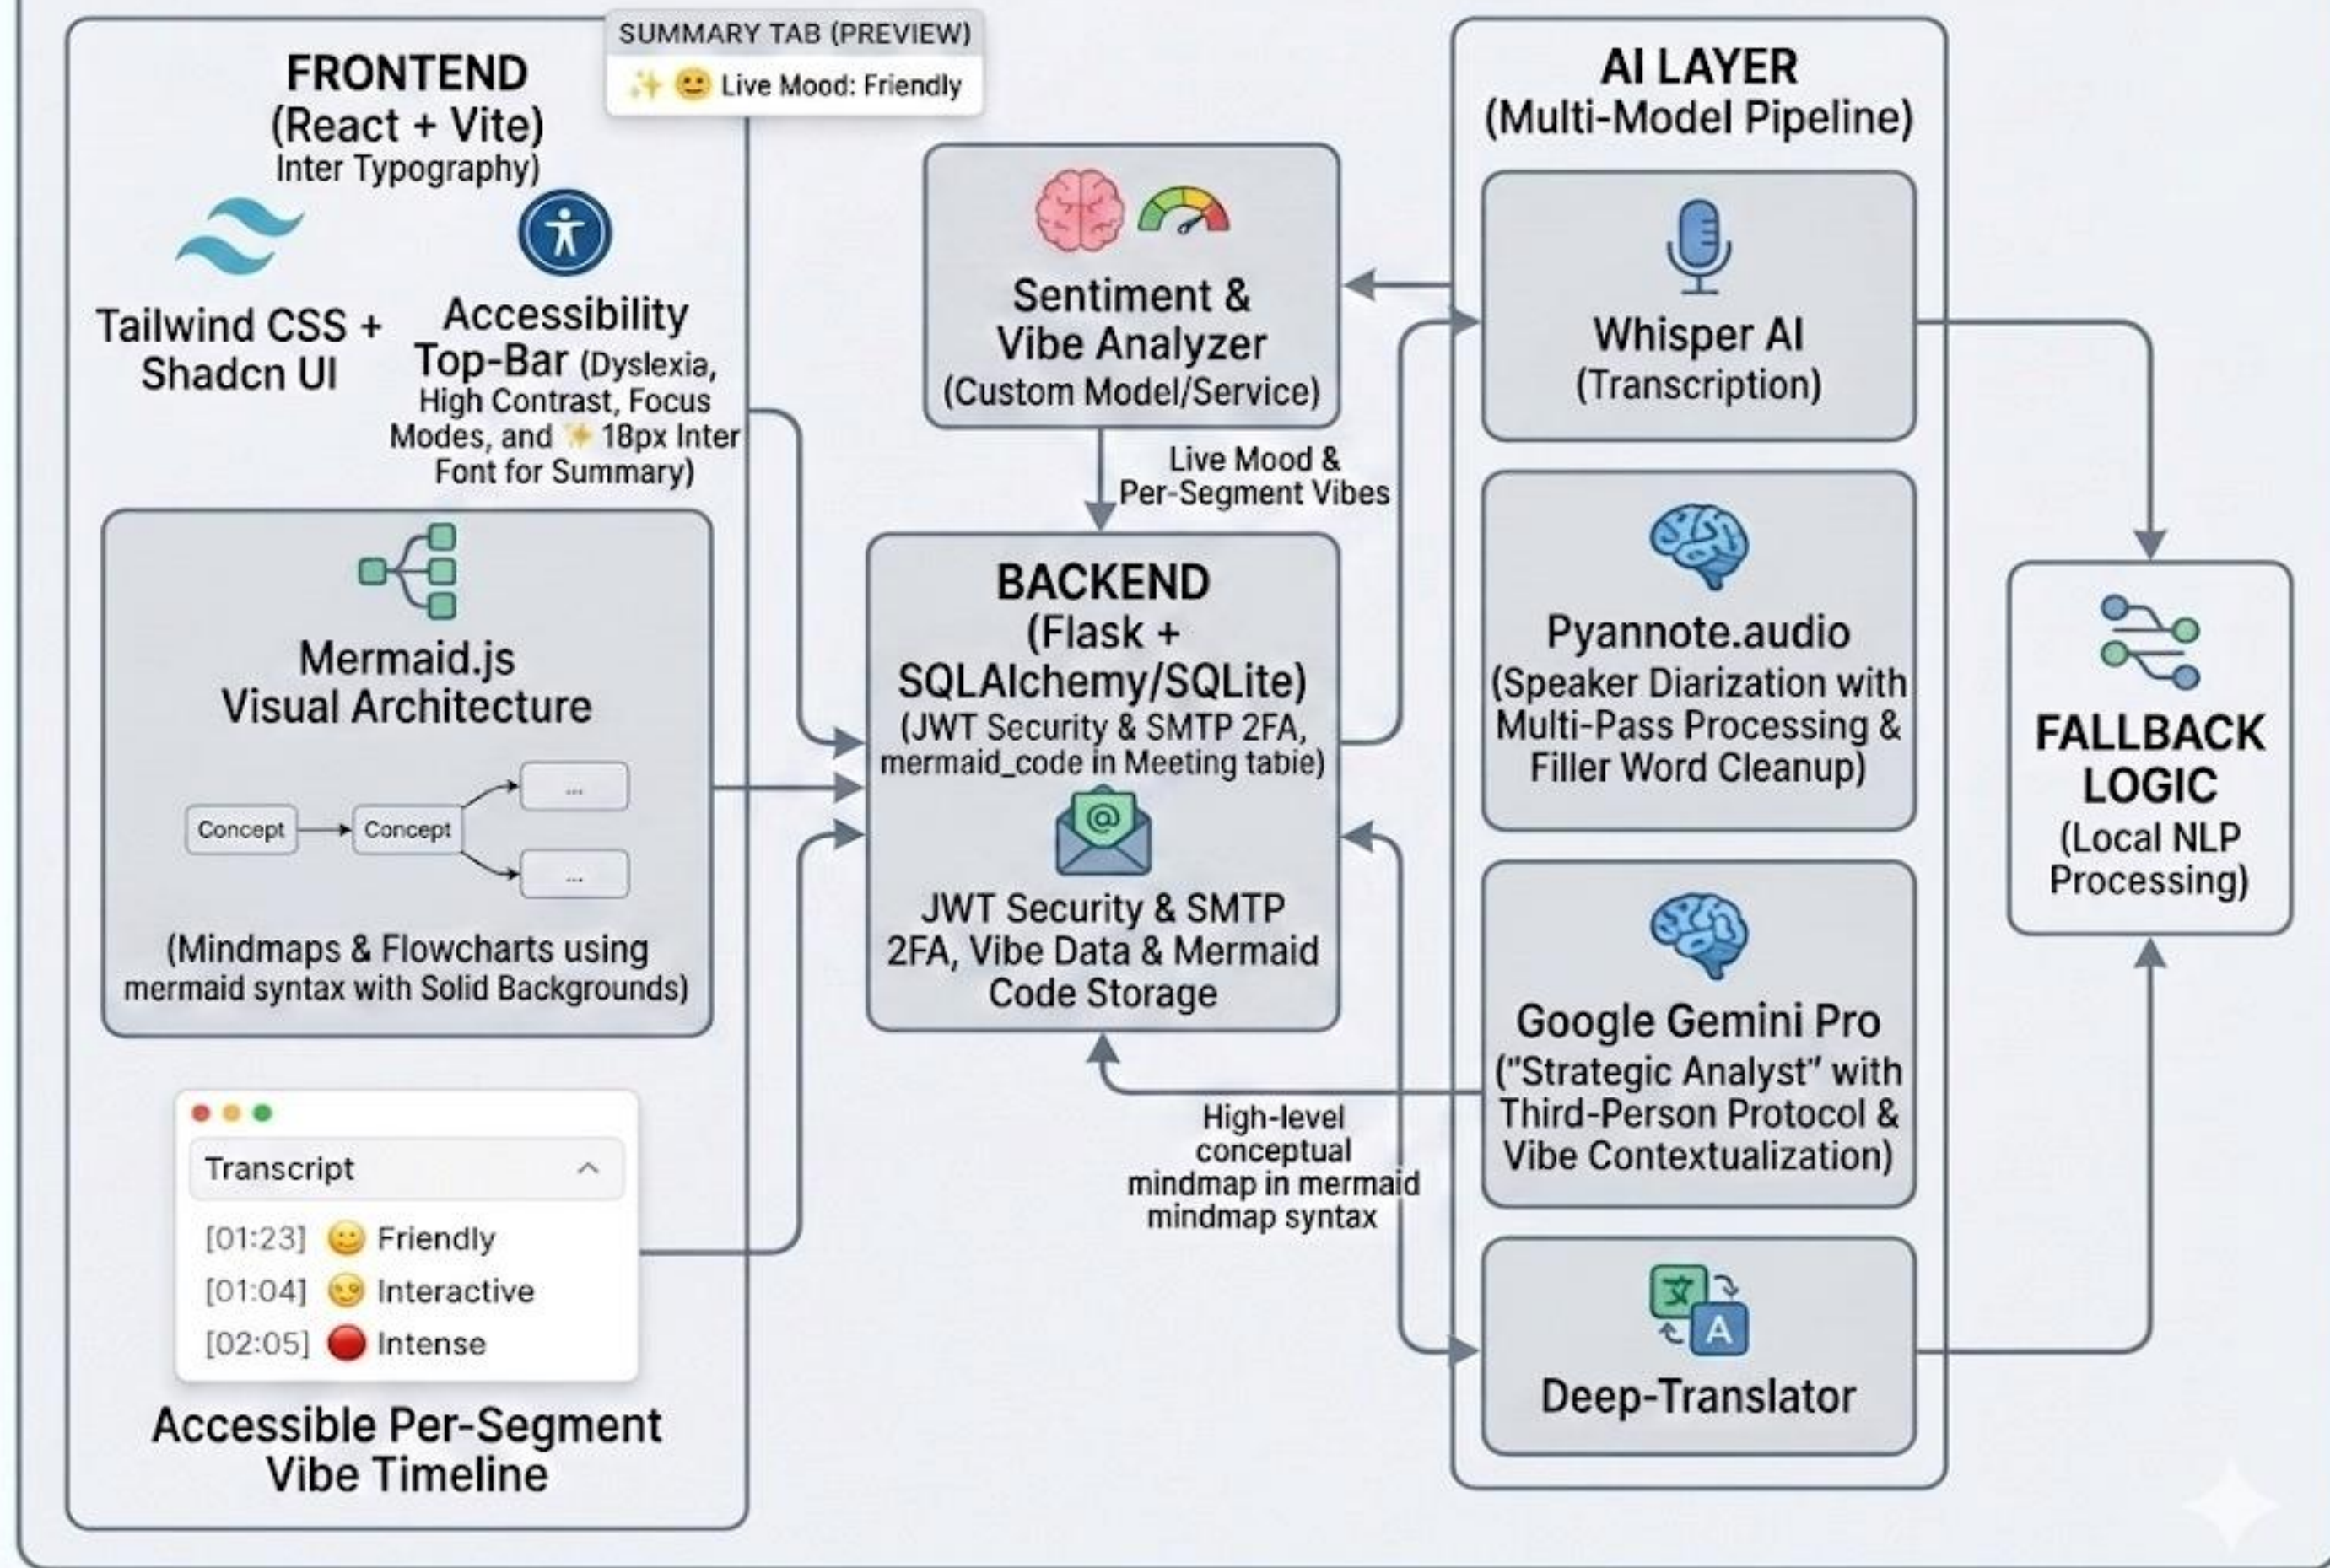

● **VADER /
TextBlob:**
The local Fallback
Logic for offline
sentiment analysis
when the cloud API
is unavailable.
